---

**Aim:** Explore the internal commands of Linux.

**Objective:**

Execute various internal commands of linux

**Theory:**

ps - report a snapshot of the current processes. ps displays information about a selection of the active processes.

cal — displays a calendar and the date of Easter

date - print or set the system date and time ,Display the current time in the given FORMAT, or set the system date.

rm - remove files or directories

mkdir - make directories , Create the DIRECTORY(ies), if they do not already

exist.rmdir - remove empty directories

cat - concatenate files and print on the standard output

wc - print newline, word, and byte counts for each file, Print newline, word, and byte counts for each FILE, and a total line if more than one FILE is specified.

ls - list directory contents

ls [OPTION]... [FILE]...

# Vidyavardhini's College of Engineering and Technology

## Department of Artificial Intelligence & Data Science

List information about the FILES (the current directory by default). Sort entries alphabetically.

`-l`: use a long listing format

`chmod` - change file mode bits

`chmod` changes the file mode bits of each given file according to mode, which can be either a symbolic representation of changes to make, or an octal number representing the bit pattern for the new mode bits.

`chown` - change file owner and group

`chown` changes the user and/or group ownership of each given file. If only an owner (a user name or numeric user ID) is given, that user is made the owner of each given file, and the files' group is not changed. If the owner is followed by a colon and a group name (or numeric group ID), with no spaces between them, the group ownership of the files is changed as well.

`pwd` - print name of current/working directory.

Print the full filename of the current working directory.

`umask` - set file mode creation mask, `umask()` sets the calling process's file mode creation mask (`umask`) to mask & 0777 (i.e., only the file permission bits of mask are used), and returns the previous value of the mask.

OUTPUT :

```

### Conclusion:

System calls are fundamental interfaces between a user application and the operating system. When a program running in user mode requires access to system resources or services that only the operating system can provide, it must make a system call. This allows the program to transition from user mode to kernel mode, where the operating system resides, and request the necessary action.

Each operating system has its own set of system calls, and they are usually exposed to user programs through a set of functions provided by the operating system's application programming interface (API). In summary, system calls are crucial for enabling user applications to utilize the full capabilities of the underlying operating system and hardware.
